

Forklift Grapple

Forklift Grapple - Grapples work in conjunction with the crowning operation of the bucket cylinder situated on the excavator. They could mount directly onto the jib or whatever quick hitch which is in bucket position. Grapples are usually used for the handling and processing of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This manufactured design provides the grapple with utmost strength and support by preventing the body from breaking and twisting through its operation.

The grapple along with all of its moving parts are constructed of hardened steel. The rotating points are designed in order to ensure supreme closing force and holding ability. The person operating it has the capacity to deal with all sizes and varieties of materials due to the jaws fitted at the end of the grapple with toes. This enables the jaws to be able to close through one another in a finger configuration for maximum handling capacity.
